

Thomas Jones

Full-Stack Software Engineer

London, UK | 07792 991253 | tomrhysjones1234@gmail.com | [LinkedIn](#) | [GitHub](#) | [Portfolio](#) |

PROFILE

Software Engineer with commercial experience in digital marketing and hands-on full-stack development experience across JavaScript, React, Node.js, Express, Python, SQL and MongoDB. Built and deployed multiple end-to-end web applications including authenticated CRUD platforms, REST APIs and full-stack MERN applications. Combines strong technical foundations with experience working in cross-functional commercial environments, collaborating with product, design and data teams to deliver digital solutions. Seeking a Junior Software Engineer, Graduate Developer, Technical Support Engineer or Product-focused technical role.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), Python, Java, HTML5, CSS3, SQL

Front-End: React (Vite, hooks, Context API), Responsive Design, CSS Flexbox/Grid, Fetch API

Back-End: Node.js, Express, Django, RESTful APIs, JWT + bcrypt, session auth, MVC/MVT

Databases: MongoDB Atlas, Mongoose ODM, PostgreSQL, relational schema design

Tools & DevOps: Git, GitHub, VS Code, Postman, Chrome DevTools, npm, GitHub Pages, Render, Heroku, Netlify

Methodologies: OOP, MVC architecture, RESTful design, ERDs & wireframes, Git workflow

PROJECTS

GigLog — Solo Project ([Live demo](#)) ([GitHub repo](#))

Node.js, Express, MongoDB Atlas, Mongoose, EJS, CSS

- Designed and built a MEN-stack web app for tracking live music gigs — users can sign up, log in and create, view, edit and delete records of gigs they have attended (artist, venue, city, date and notes); planned up front with an ERD and wireframes.
- Implemented the seven RESTful routes (INDEX, NEW, CREATE, SHOW, EDIT, UPDATE, DELETE) in Node.js and Express, following the MVC pattern to separate routes, controllers and EJS views.
- Modelled the data in MongoDB Atlas using Mongoose with a 1-to-many User-to-Gig relationship (gig stores an ObjectId reference to its owner), so users only see and edit their own data.
- Built user authentication (sign up, log in, log out) with hashed passwords and session handling, protecting write routes behind auth middleware.

SetlistLab — Solo Project ([Live demo](#)) ([Front-end repo](#)) ([Back-end repo](#))

React (Vite), Node.js, Express, MongoDB Atlas, Mongoose, JWT, bcrypt, Context API

- Designed and built a full-stack MERN application that helps live performers manage their songs and build setlists for specific gigs, architected as two independent repos — a React (Vite) front-end and an Express REST API with separate route modules for auth, songs and setlists (including endpoints to add or remove songs from a setlist).
- Modelled three Mongoose collections (User, Song, Setlist) using ObjectId references; each setlist holds an array of song references, giving users a many-to-many link between songs and setlists.
- Implemented JWT authentication with bcrypt password hashing, token-protected API routes via Express middleware and persistent login on the client by storing the JWT in localStorage.
- Built the React front-end with Context API for global auth state, reusable components (Dashboard, SongForm, SongList, SetlistForm, SetlistList, SetlistDetail), Fetch API calls and a responsive CSS Grid/Flexbox layout.

Record Shelf — Solo Project (Capstone) ([Live demo](#)) ([GitHub repo](#)) ([Trello board](#))

Python, Django, PostgreSQL, Heroku, HTML5, CSS3

- Designed and built a full-stack Django CRUD web application for managing a personal vinyl record collection, deployed live on Heroku with a PostgreSQL database.
- Implemented Django models, views, templates and URL routing following the MVT pattern; modelled the data in PostgreSQL with a User-to-Record one-to-many relationship so users only see and edit their own collection.
- Built secure authentication using Django's built-in auth system with hashed passwords and login-protected views, and implemented full CRUD on records with form validation and server-side error handling.

- Planned and ran the project as a solo two-week sprint using a Trello kanban board, an ERD and wireframes; deployed to Heroku with the Postgres add-on, environment variables and static file management.

Ocean Match — Solo Project ([Live demo](#)) ([GitHub repo](#))

HTML5, CSS3, JavaScript (ES6), Git/GitHub

- Designed, built and deployed a browser-based marine-life memory-matching game on GitHub Pages, where players flip tiles to pair up sea creatures before time or mismatches run out.
- Wrote all game logic from scratch in vanilla JavaScript: grid generation, tile shuffling, match detection and state handling for matches, mismatches and win/lose conditions.
- Implemented three difficulty levels (Easy 3×3, Medium 5×4, Hard 6×4), a countdown timer and a mismatch limit — giving each round two distinct fail states for a more balanced challenge.
- Built a responsive, accessible UI with semantic HTML, a Flexbox/CSS Grid layout, CSS animations and a confetti celebration on wins; fully replayable without a page reload.

EMPLOYMENT HISTORY

Digital Marketing Executive — Reach plc

Jul 2021 — Oct 2023 | London

- Analysed campaign datasets to identify performance issues and optimise outcomes.
- Collaborated with product, design, analytics and commercial stakeholders on digital projects.
- Worked with Salesforce, Marin and analytics platforms to troubleshoot technical and tracking issues.
- Managed multiple concurrent projects while delivering against commercial deadlines.
- Worked with structured data, tracking pixels and HTML landing pages to support campaign implementation.

Freelance Digital Consultant — Self-employed

Sep 2019 — Jun 2021 & Oct 2023 – Sep 2024

- Built and customised websites and landing pages using HTML, CSS and site builders (Squarespace, Shopify), giving me my first hands-on exposure to web technologies.
- Took ownership of projects end-to-end — gathering requirements from clients, planning the work and delivering a working product.

EDUCATION

Postgraduate Study in Software Engineering (Conversion) — University of Westminster

Sep 2024 — Jul 2026 | London

- Core modules: Object-Oriented Programming (Java), Software Engineering Principles, Data Structures & Algorithms, Databases (SQL), Web Development, Agile Development.
- Group coursework: led a team software-engineering project as project manager — planning, task allocation, board management and on-time delivery.

Software Engineering Immersive — General Assembly

Sep 2025 – May 2026 | Intensive full-stack bootcamp

- Intensive full-stack curriculum covering JavaScript, React, Node/Express, MongoDB, REST APIs, JWT and session auth, Git/GitHub and deployment — assessed via four graded solo projects (Units 1–4).

London School of Musical Theatre — Diploma

Sep 2018 — Sep 2019 | London

MSc Strategic Digital Marketing — University of South Wales

Sep 2017 — Sep 2018 | Cardiff

BA (Hons) Contemporary Music Performance, 2:1 — University of South Wales

Sep 2014 — Jul 2017 | Cardiff

A Levels & GCSEs — Clifton College, Bristol

Sep 2012 — Jul 2014

- 3 A Levels. 9 GCSEs including Maths and English

ADDITIONAL

- Topping up my stack outside the course via freeCodeCamp (Responsive Web Design, JavaScript Algorithms & Data Structures) and Udemy (JavaScript, Python), and pushing code to GitHub regularly.
